Three Materials in One Application
WR® 300/525/575 Materials Double MTBF of Boiler Circulation Pump

Challenge
The customer needed to remove asbestos bearing materials in the Hayward Tyler wet wound motor boiler feed pumps to comply with legislation. These pumps are used in a variety of power plants. In this particular application, the pump was used by a coal-fired power plant.

Solution
After testing several competitive bearing materials the customer decided on Greene Tweed’s WR® materials as the new bearing and thrust material. The WR® material was selected because it showed negligible wear during the test cycle.

Customer Goals
Leading pump OEM in the U.K. wanted to increase MTBF (mean time between failure) over four years which was the maximum running time of the conventional bearing material so far.

Applications
This pump circulates cooling water in boiler feed applications. Boiler circulating pumps contain wet wound stator motors that traditionally used “Ferrobestos” bearings for both the journal and thrust bearings.
Benefits

- **Reliability/MTBF** - Due to the WR® material upgrade the pump’s MTBF (mean time between failure) increased from 4 to 9 years so run times could be more than doubled. The pump deployed 0 faults and still continues to run smoothly. The pump uses three different WR® materials in three different areas, showing the versatility of the WR® portfolio.

- **Customer increased lifetime of the pump while complying with environmental regulations.**

- **Dry-Run Protection** - Nongalling and nonseizing properties of WR® help avoid catastrophic pump failures caused by dry-run startup or excessive vibration.

- **Easy to install** - Not brittle or easily damaged during installation, like other materials, e.g., ceramics. Greene Tweed provides total engineered solutions and final machined clearances.

Due to the WR® material upgrade the pump’s MTBF (mean time between failure) increased from 4 to 9 years so run times could be more than doubled.
